

## Pacific Pests and Pathogens - Mini Fact Sheet Edition

<https://apps.lucidcentral.org/ppp/>

### Casuarina butt rot (195)

Photo 1. *Ganoderma applanatum* growing from the base (butt) of *Casuarina equisetifolia*. Note that the fruit body is flat, brown above, and white underneath.

Photo 2. Close-up of a fruit body of *Ganoderma applanatum*, showing the brown, bumpy, topside and the white underside.

Photo 3. *Casuarina equisetifolia* killed by *Ganoderma applanatum*.

### Summary

- Worldwide distribution. Temperate, sub-tropical and tropical. An important disease.
- On *Casuarina* and many broadleaf and fir trees, causing rots in the heartwood of roots, butts, stems.
- Difficult to detect: yellowing, slower growth, dieback, death. Trees become susceptible to be blowing over in the wind.
- Fruit body grey-brown, up to 50 cm, uneven with rings, on dead or living trees, white below with pores.
- Spread by root-to-root contact and/or spore infections.
- Cultural control. There is no control. Once a tree is infected it will die. When brackets are first seen, it is best to remove the tree to prevent infection of those nearby. Avoid wounding trees.
- Chemical control: none recommended.

### Common Name

Casuarina butt rot. Also see **Fact Sheet no. 004** for butt and root rots of other trees.

### Scientific Name

*Ganoderma applanatum*. The fungus was previously known as *Fomes applanatus*. The common name for the fungus is the Artist's Conk.
