Taro hornworm (032)

Photo 1. A caterpillar of taro hornworm, *Hippotion celerio*, eating a leaf and leaving only the veins.

Photo 2. Severe damage to taro caused by the taro hornworm, *Hippotion celerio*; the leaves have been eaten leaving only the leaf stalks or petioles.

Photo 3. Solitary egg of taro hornworm, *Hippotion celerio*.

Photo 4. When mature the caterpillars of taro hornworm, *Hippotion celerio*, are dark brown.

Photo 5. Pupa taro hornworm, *Hippotion celerio*.

Photo 6. Adult taro hornworm, *Hippotion celerio*.

Summary

- Widespread distribution. In tropical and temperate Asia, Oceania. An important pest.
- Eggs are laid on the leaves and petioles. Mature caterpillars eat between veins, sometimes all the leaf.
- Look for the horn and the large eye spots.
- Outbreaks uncommon because of natural enemies, and other control measure not needed.
- Natural enemies: parasitoid wasps.
- Cultural control: visit garden regularly; handpick caterpillars; allow chickens into the taro fields.
- Chemical control: not usually required. If needed, use PDPs: neem, pyrethrum, or chilli; use products from bacteria, e.g., spinosad or Bt (*Bacillus thuringiensis*) on young caterpillars. Alternatively, use synthetic pyrethroids, but likely to kill natural enemies.

Common Name

Taro hornworm

Scientific Name

Hippotion celerio
