Taro (*Leptosphaerulina*) leaf spot (318)

Photo 1. Leaf spots on taro, white, some merging, others falling out, caused by *Leptosphaerulina trifolii*.

Photo 2. Leaf spots on taro, caused by *Leptosphaerulina trifolii*.

Photo 3. Leaf spots on taro, on the underside of the leaf, caused by *Leptosphaerulina trifolii*.

Summary

- Worldwide distribution. On taro, legumes, and many other vegetables, and weeds. A fungal disease of minor importance.
- Associated with leaf spots or dead areas on a number of hosts, e.g., leaf spots on pepper (capsicum), a target spot on beans, leaf spots and corm rots on taro. On alfalfa, tan leaf spots are surrounded by brown margins, giving an "eyespot", sometimes with a yellow halo.
- Spread in rain and wind, and possibly seedborne.
- Cultural control: generally no recommendation; however, on alfalfa in the USA, lepto leaf spot is managed by early harvests; avoiding leaving cut plants in the field; crop rotations avoiding forage legumes for 2 years; and resistant varieties.
- Chemical control: none recommended.

Common Name

Taro (*Leptosphaerulina*) leaf spot. CABI gives the preferred common name as soyabean leaf spot. In the USA, it causes alfalfa lepto leaf spot. Alfalfa is a forage legume.

Scientific Name

Leptosphaerulina trifolii. Previously known as *Sphaerulina trifolii* and *Leptosphaerulina briosiana*.

AUTHORS Grahame Jackson & Eric McKenzie
