Photo 3. Comparison of features of the Asian subterranean termite, *Coptotermes gestroi*, and the Formosan subterranean termite, *Coptotermes formosanus*.

### Summary

- Worldwide distribution. In Oceania, recorded from Fiji (Lautoka only), and French Polynesia (Marquesas Islands).
- Damage: destructive, feeding on paper, clothes, living trees (preference) - mango, citrus, coconut, cassava. Mostly, lives underground.
- Colonies started by king and queen - queen laying 1000 eggs/day; eggs produce blind workers (dig tunnels, collect food, care for brood), and soldiers (larger, defend colony, emit toxic substances); colonies up to 1 million.
- Spread: i) each year swarms of 'reproductive' occur and pairs of kings and queens seek new places to start colonies; ii) colonies move long distances in e.g., wooden shipping pallets.
- Cultural control: Fiji has eradication plan: surveys, containment, community surveillance (<http://baf.com.fj/news/asian-subterranean-termites>). Where established, measures needed concerning drainage, ventilation, treatment of timber, treatment of swarms.
- Chemical control: Chemicals for preservation of timber; soil barriers to prevent termite invasions beneath houses; and monitoring baits, need be applied by professional pest control operators.

### Common Name

Asian subterranean termite

### Scientific Name

*Coptotermes gestroi*. It was previously known as *Coptotermes havilandi*.
