## Citrus snow scale (105)

Photo 1. Female citrus snow scale, *Unaspis citri*. The female is very different from the male; it is oval, brown-black and 2 mm long, whereas the male is 1 mm, and white.

Diagram. Life-cycle of an armoured scale.

### Summary

- Worldwide distribution. Mostly, citrus, but the Pacific banana is a host. An important pest.
- The scale has tube-like mouthparts, sucking sap from stems. Heavy infestations cause leaf fall and dieback.
- Eggs hatch and “crawlers” walk or spread by wind, settle, feed and produce the protective armour, oyster-shaped in females, white and straight in males. Males become fly-like, without mouthparts, mate and die.
- Natural enemies: ladybird beetles and parasitoid wasps.
- Cultural control: scale-free nursery stock; *Gliricidia* windbreaks to protect from spread of “crawlers”; adequate nutrition.
- Chemical control: use lime sulphur or wettable sulphur, leaving 30 days if also spraying oils (READ INSTRUCTIONS); alternatively, spot-spray infestations with horticultural oil, white oil, or soap solution (see **Fact Sheet no. 56**); avoid malathion and synthetic pyrethroids - they will kill natural enemies.

### Common Name

Citrus snow scale, white louse scale

### Scientific Name

*Unaspis citri*
