### Mango flower webworm (334)

Photo 1. Webbing of flowers by mango flower webworm, *Dudia aprobola*.

Photo 2. Larva of the mango webworm, *Dudia aprobola*.

Photo 3. Adult mango webworm, *Dudia aprobola*.

#### Summary

- Widespread distribution. On mango, other fruit trees, ornamentals, and weeds. Probably important, but several webworms on mango.
- Larvae web together flowers, young fruits and leaves; leaves rolled and larvae feed from inside.
- Eggs on undersides of leaves; larvae yellowish green, with heads and first two pairs of legs black. Adults pale brown with dark markings, up to 20 mm long.
- Natural enemies: not recorded in Pacific islands (but assumed present).
- Cultural control: prune trees giving sprays better access.
- Chemical control: use Bt (*Bacillus thuringiensis*): ensure good coverage of shoots and flowers; treat when larvae small, and when webbing first seen. Avoid pyrethroids and organophosphates: they will kill natural enemies.

#### Common Name

Mango flower webworm

#### Scientific Name

*Dudia aprobola*; previously known as *Platyepplus aprobola*.
