### Squash leaf-footed bug (165)

Photo 1. *Leptoglossus* nymphs feeding on wild cucurbit.

Photo 2. Leaf-footed bug, *Leptoglossus* species, on snake gourd.

Photo 3. Leaf-footed bug, *Leptoglossus* species, on tomato clearly showing the "leaf" of the leg.

Photo 4. Leaf-footed bug, *Leptoglossus* species, on luffa.

Photo 5. Leaf-footed bug, *Leptoglossus* species, on flower of pumpkin with "leaf" of the leg clearly showing.

### Summary

- Widespread distribution. In Asia, Oceania. On snake gourd, melon, cucumber and other cucurbits, the main hosts. Occasionally, an important pest.
- Nymphs and adults suck sap from leaves, stems, fruits. Fruits, shrivel, rot and fall.

- Eggs laid on leaves and stems. Nymphs reddish, darkening later and developing outgrowths on legs. Very long mouthparts.
- Natural enemies: no reports from Pacific islands; elsewhere, assassin bugs, mantids, spiders and wasps.
- Cultural control: avoid planting new crops next to old; handpick – bugs are slow-moving in early morning; collect trash and burn after harvest.
- Chemical control: PDPs: derris or pyrethrum; or synthetic pyrethroids, but they are likely to kill predators.

## Common Name

Leaf-footed bug, squash bug

## Scientific Name

*Leptoglossus* species; *Leptoglossus gonagra* (previously known as *Leptoglossus australis*) is the common species in the Pacific islands.
