Sugarcane eye spot (305)

Photo 1. Reddish-brown elliptical spots with yellow margins, caused by the sugarcane eyespot fungus, *Bipolaris sacchari*. Notice the yellow "runners" associated with the spots (see text).

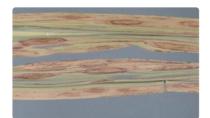

Photo 2. Merging spots of sugarcane eyespot, Bipolaris sacchari.

Summary

- Widespread distribution. On sugarcane, and related grass weeds. A minor fungal disease of commercial sugarcane varieties.
- Seedling blights, and spots on the leaves (eyespots) parallel to the veins, oval, 12 mm long x 6 mm wide, reddish with pale yelow halo. Reddish-brown to yellow streaks above the eyespots, called "runners" caused by toxins.
- Spread is by spores produced in the eyespots blown in wind and rain.
- Cultural control: varietal control is the only recommendation.
- Chemical control: fungicides are not recommended.

Common Name

Sugarcane eye spot

Scientific Name

Bipolaris sacchari. Previous names are Cercospora sacchari, Drechslera sacchari and Helminthosporium sacchari.

AUTHORS Grahame Jackson & Eric McKenzie
