

Papaya ringspot (virus-P) (194)

Summary

- Worldwide distribution. On papaya and cucurbits. An important disease.
- Leaves with yellow and green patterns, distorted, small. Older leaves with dark green streaks on the stalks. Ringspots on the fruit.
- Spread by (i) aphids, (ii) the trade in nursery plants.
- Cultural control: remove volunteer papaya; restrict people entering plantations; remove disease trees in new plantations, and those in old blocks; netting; resistant varieties offer best (only) solution.
- Chemical control. not appropriate as aphids pick up virus from disease plants and spread it to healthy trees before insecticides kill them.

Common Name

Papaya ringspot (virus-P)

Scientific Name

Papaya ringspot potyvirus-P. The abbreviation for this virus is PRSV. There is another strain of this virus called *Papaya ringspot virus*-W. These two strains are very similar, except that type PRSV-W does not infect papaya; it infects cucurbits. Previously, the strain infesting cucurbits was known as *Watermelon mosaic virus*-1.
