Acacia jucunda occurrence map.
Occurrence map generated via Atlas of Living
Australia (<https://www.alb.org.au>).

Family

Fabaceae

Distribution

Occurs from Mt Moffat (W of Carnarvon Natl Park) E to near Eidsvold, southern Qld, S to near Yetman in northern N.S.W.

Description

Shrub or tree 2–8 m high. Branchlets pruinose, microscopically hirtellous with hairs usually c. 0.05 mm long. Phyllodes usually oblanceolate and obtuse or retuse, 3–6.5 cm long, 7–20 (–23) mm wide, thin, grey-green to glaucous, glabrous or microscopically hirtellous on margins and/or midribs or rarely entire laminae, 1-nerved, finely pinninerved; gland not prominent, 0–3 mm above pulvinus; pulvinus 2–5 mm long. Inflorescences usually 10–20-headed racemes; raceme axes usually 3–5 cm long, glabrous to subglabrous; peduncles 2.5–6 mm long, glabrous to subglabrous; heads showy, globular, subdensely 15–25-flowered, bright golden. Flowers 5-merous; sepals united. Pods alternately rounded over seeds on either side along midline, to 9 cm long, 8–11.5 mm wide, firmly chartaceous to thinly coriaceous, pruinose, glabrous; stipe slender. Seeds longitudinal to oblique, oblong, 4–6 mm long, slightly shiny, black, arillate.

Habitat

Grows in sand, loam or clay loam in open eucalypt woodland or forest, often adjacent to Brigalow forest.

Specimens

Qld: Moonie, c. 56 km WSW of Tara, L.Pedley 2361 (BRI). N.S.W.: Bebo State Forest, E of Yetman, R.Coveny 11682 & P.Wilson (AD n.v., BRI, CANB, K n.v., MEL n.v., NSW, PERTH, US n.v.).

Notes

The syntypes, collected from the northern extremity of the species range, differ from specimens elsewhere in having branchlet hairs 0.1–0.2 mm long, and narrowly elliptic phyllodes; in addition, sometimes their phyllodes are acute and their racemes to 9 cm long with up to 30 heads. An unnumbered, undated Bancroft collection, not regarded as a type even though it was collected from Eidsvold, is queried at BRI as being an *A. jucunda* × *A. pustula* hybrid (BRI340955 & 340956). It has narrowly elliptic, acute phyllodes and branchlet hairs 0.1–0.2 mm long. The possibility therefore exists that the type collection of *A. jucunda* may include hybrid elements.

Closely related to *A. everistii*.

An attractive, floriferous species which is cultivated to some extent.
